##**Name:**K.Saivinay ##**Roll No:**21X05A6731 ##**Branch:**Data Science Final Year ##**College:**Narsimha Reddy Engineering College

#**Project Title:** ##Prediction of "Iris.csv" dataset for decision tree algorithm using Supervised Learning Machine algorithm

#**Problem Statement:** ##A american based botnical garden a grow iris flower in their labs but using Bio-Technology in a single tree different type of varity flower is grow as a data science engineer find out how much accuracy is their all categories contain same species.

[1]:
```
from sklearn.datasets import load_iris
from sklearn.model_selection import train_test_split
from sklearn.tree import DecisionTreeClassifier
from sklearn.metrics import accuracy_score
```

[2]:
```
# Load the Iris dataset
iris = load_iris()
X = iris.data
y = iris.target
```

[3]:
```
# Split the dataset into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,␣
 ↪random_state=42)
```

[4]:
```
# Create a Decision Tree classifier
decision_tree = DecisionTreeClassifier()
```

[5]:
```
# Train the classifier on the training data
decision_tree.fit(X_train, y_train)
```

[5]:
```
DecisionTreeClassifier()
```

[6]:
```
# Make predictions on the test data
y_pred = decision_tree.predict(X_test)
```

[8]:
```
# Calculate accuracy
accuracy = accuracy_score(y_test, y_pred)
print(f"Accuracy: {accuracy:.2f}")
```

```
Accuracy: 1.00
```

#**Conclusion:** ##According to my model only 1 percent is accuracy for getting all species.
